Software Packages for Deep Learning

Chensong Zhang

with Zheng Li and Ronghong Fan

DL Seminar — April 27, 2017

Outline

Introduction

Python

Torch

Caffe

TensorFlow

MxNET

Comparison

Machine Learning

ML gives computers the ability to learn without being explicitly programmed [Samuel 1959]

ML explores the study and construction of algorithms that can learn from and make predictions on data

Data mining, computational statistics, optimization, ...

Fourth paradigm, big data, deep learning, artificial intelligence

General Tasks of ML

Classification: Inputs are divided into two or more classes, and the learner must produce a model that assigns unseen inputs to one or more (multi-label classification) of these classes

Clustering: Inputs are divided into groups. Unlike in classification, the groups are not known beforehand, making this typically an unsupervised task

Regression: Similar to classification, but the outputs are continuous rather than discrete

Other tasks: density estimation, dimensionality reduction, ...

Packages for General Machine Learning

What is the purpose?

Solving problems from practical applications (user interface)

Developing algorithms and optimizing implementation (development)

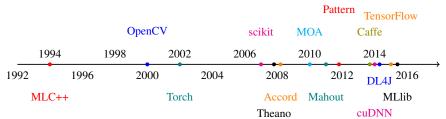

Theoretical analysis for machine learning

What do we want for a ML package?

Easy for new tasks and new network structures (less steep learning curve)

Easy for debugging (with good support and large community)

Performance and scalability

Deep Learning

Comparison

Table: Framework Comparison: Basic information

Viewpoint	Torch	Caffe	TensorFlow	MXNet
Started	2002	2013	2015	2015
Main Developers	Facebook, Twitter, Google,	BVLC (Berkeley)	Google	DMLC
License	BSD	BSD	Apache	Apache
Core	C/Lua	C++	C++	C++
Languages	C/Lua	C++	Python	Python
Supported	Lua	C++/Python	C++/Python	C++/Python
Interface	Lua	Matlab	R/Java/Go	R/Julia/Scala

Comparison

Table: Framework Comparision: Performance

Viewpoint	Torch	Caffe	TensorFlow	MXNet	
Pretrained	Yes	Yes	No	Yes	
Models	168	168	NO		
Low-level	Good	Good	Fairly good	Very few	
Operators	Good	Good	ranny good	very lew	
High-level	Good	Good	Good	Good	
Support	Good	Good	Good	Good	
Speed	Great	Great	Not so good	Excellent	
One-GPU	Great	Great	Not so good	Excellent	
Memory	Great	Great	Not so good	Excellent	
Management	Great	Great	Not so good	Executent	
Parallel	Multi-GPU	Multi-GPU	Multi-GPU	Distributed	
Support	Multi-OF U	With-OF C	With-OF C	Distributed	

Python: A general-purpose programming language

Created by Guido van Rossum in 1989 and first released in 1991

Named after "the Monty Python" (British comedy group)

An interpreted language—simple, clear, and readable

Python has many excellent packages for machine learning

The language of choice in introductory programming courses

Data from Indeed.com 2016	SQL
	JAVA
	JAVASCRIPT
	C#

3		PHP		9.4 %	-1.2 %
4		C#		8.3 %	-0.3 %
5	↑ ↑	Javascript		7.7 %	+0.4 %
6		C		7.0 %	-0.2 %
7	↓↓	C++		6.9 %	-0.6 %
8		Objective-C		4.2 %	-0.6 %
9	1	R		3.4 %	+0.4 %
10	↓	Swift		2.9 %	+0.1 %

Python for Scientific Computing

Why Python for scientific computing?

Strong introspection¹ capabilities (???What does even mean???)

Full modularity, supporting hierarchical packages

Exception-based error handling

Dynamic data types and automatic memory management

Why consider such a slow language for simulation?

Good for proof-of-concept

Implementation time versus execution time

Code readability and maintenance — short code, fewer bugs

Well-written Python code is "fast enough" for most computational tasks

Time critical parts executed through compiled language or available packages

Built-in Data Structures

```
Numeric types—int, float, complex, ex: a=1, b=1.0, c=1L, d=0xf, e=010, f=1+2j Sequence types—list, tuple, str, dict, ex: g=[3.14, True, 'Yes', [1], (1L,)] + [False] + [None]*3, h=(3.14, True, 'Yes', [1], ()), i='Hello' + "," + "'world!"", j={1: 'int', 'pi': 3.14}
```

Control Flow

If-then-else

```
a = 1
if a > 0:
print "a_is_positive"
elif a=0:
print "a_is_zero"
else:
print "a_is_negative"
```

For loop

• While loop

Functions and Modules

Defining functions

Using modules

There are 3 different ways to use modules. Examples are below. 1. import math This will only introduce the name math into the name space in which the import command was issued. The names within the math module will not appear in the enclosing namespace: they must be accessed through the name math. For example: math.sin(3.14). 2. from math import * This does not introduce the name math into the current namespace. It does however introduce all public names of the math module into the current namespace, directly using: sin(3.14) 3. from math import sin This will only import the sin function from math module and introduce the name sin into the current namespace, but it will not introduce the name math into the current namespace, directly using: sin(3.14)

Programming interface

Example 1

Programming interface

Example 1

Computational graph

Programming interface

Visualization

Example 1: SoftMax

```
import tensorflow as tf
X = tf.placeholder(tf.float32, [None, 28, 28, 1])
W = tf. Variable(tf. zeros([784, 10]))
b = tf. Variable(tf.zeros([10]))
init = tf.initialize_all_variables()
# model
Y= tf.nn.softmax(tf.matmul(tf.reshape(X,[-1, 784]), W) + b)
# placeholder for correct answers
Y = tf.placeholder(tf.float32, [None, 10])
# loss function
cross entropy = -tf.reduce sum(Y * tf.log(Y))
# % of correct answers found in batch
is\_correct = tf.equal(tf.argmax(Y,1), tf.argmax(Y_1))
accuracy = tf.reduce_mean(tf.cast(is_correct, tf.float32))
```

Example 1:SoftMax

```
optimizer = tf.train.GradientDescentOptimizer(0.003)
train_step = optimizer.minimize(cross_entropy)
sess = tf. Session()
sess.run(init)
for i in range (10000):
        # load batch of images and correct answers
        batch_X, batch_Y = mnist.train.next_batch(100)
        train data={X: batch X, Y: batch Y}
        # train
        sess.run(train_step, feed_dict=train_data)
        # success ? add code to print it
        a,c = sess.run([accuracy, cross_entropy], feed=train_data)
        # success on test data?
        test_data = {X: mnist. test.images, Y_: mnist. test.labels}
        a, c = sess.run([accuracy, cross_entropy], feed=test_data)
```
